

Work class to get more practice with our trig questions.

What have you learned so far?

- more than one triangle in a question.
- solve one triangle first to share a side with the next one.
- horizon is straight across
- a question can be made into right triangles and that angle of elevation and angle of depression is the SAME angle.
- z-rule in red shows the connection between the two angles.

typical trig questions are buildings, lighthouses, ramps, and you can predict these.

Q11

$$\text{angle } \textcircled{1} = \tan^{-1}\left(\frac{10}{5}\right) = 63.4^\circ$$

$$\text{angle } \textcircled{2} = 90^\circ - 63.4^\circ = 26.6^\circ$$

$$\text{angle } \textcircled{3} = 180^\circ - 63.4^\circ - 63.4^\circ = 53.2^\circ$$
